What is this about?: Two Dimensional Air Drop Model is a small, easy to use, Java based tool specifically designed to simulate the two dimensional air drop model in which a small islet is being supplied by a Dutch Red Cross plane. When the test user is the captain, she is able to operate the plane's time and drop control functions. The islet's tide is also taken into account. Island Locations: Two Dimensional Air Drop Model is a simple, Java based tool to give your users an idea of the time of day and location of various islets. You will be able to tell your users which islands are likely to be invaded, which are likely to be successful (if supplied), and which are vulnerable (if the supply team is not sufficient). It will show you where in the ocean your supply will most likely be found, and also allow you to choose a time of day to give your supply team the best chances to find and pick up supplies before the tide takes hold, or at a time of day when a supply will most likely hit land. Example: If you are providing supplies to an island that you see that is viable as a supply location, supply it with supplies early in the morning before the tide will take you out of the water. Important features: Two Dimensional Air Drop Model is Java based and can be run on any computer with Java 1.2 or greater installed. It can also run on a range of systems, being run on a Windows machine, a Linux machine, and a Unix machine. To set up the game, the user fills in the island's coordinates and select the package to be dropped. In the next step, the player chooses the size and the weight of the package to be dropped. The airplane must be launched at the right moment, after the package has been dropped. The software performs the drop at this moment, displaying the package trajectory while reporting the time of the drop. The package will hit the ocean only if the drop time isn't the right moment. The model provides a convenient and detailed tool to visualize and test drop trajectories and landing times. Use the floating report window to print a readable PDF file of your drop. If you want to double check the report, you can use the save button and export the trajectory as a simple ASCII file.
